Violations that Can Be Found on an Intermodal Chassis

A drum brake is a brake that uses friction caused by a set of shoes or pads that press outward against a rotating cylinder-shaped part called a brake drum.. The term drum brake usually means a brake in which shoes press on the inner surface of the drum. When shoes press on the outside of the drum, it is usually called a clasp brake. Where the drum is pinched between two

3. Check brake chamber push rod travel (refer to chart below for the CVSA adjustment limit. With the parking brakes released and service brakes applied with 80 to 90 psi of air pressure to the service chambers. 4. Check the angle formed between the brake chamber push rod and the slack adjuster arm.

Bendix Air Brake System Troubleshooting

A disc brake is a type of brake that uses the calipers to squeeze pairs of pads against a disc or a "rotor" to create friction. This action slows the rotation of a shaft, such as a vehicle axle, either to reduce its rotational speed or to hold it stationary. The energy of motion is converted into waste heat which must be dispersed.. Hydraulically actuated disc brakes are the most commonly used
