is the series of events in the growth and division of a cell. In the prokaryotic cell cycle, the cell grows, duplicates its DNA, and divides by pinching in the cell membrane. The eukaryotic cell cycle has four stages (the first three of which are referred to as).

10.1 Cell Growth, Division, and Reproduction

Completes cell division of cytoplasm after nucleus had divided. Animal cells: Cell membrane is drawn in until the cytoplasm is pinched into two equal parts. Plant cells: Cell membrane not flexible enough because of cell wall so a cell plate forms between the divided nuclei that develops into cell membranes. Then a cell wall forms between the two new membranes.
