Heat and States of Matter

Updated June 05, 2019 Matter occurs in four states: solids, liquids, gases, and plasma. Often the state of matter of a substance may be changed by adding or removing heat energy from it. For example, the addition of heat can melt ice into liquid water and turn water into steam.

States of Matter: Solid, Liquid, Gas, and Plasma

Matter can exist in a solid, liquid or gaseous state, and the state a substance is in can be largely determined by its temperature. When a certain temperature threshold unique to each substance in the universe is crossed, a phase change will result, changing the state of the matter.

States of Matter: Basics

Matter undergoes phase changes or phase transitions from one state of matter to another. Below is a complete list of the names of these phase changes. The most commonly known phase changes are those six between solids, liquids, and gasses. However, plasma also is a state of matter, so a complete list requires all eight total phase changes.

We have found a common form of matter which can exist in three states. Heat is involved in changing from one state to another. The solid 2--2 Figure 2.1 Ice, water and steam are the solid liquid and gas states of water state melts when it is heated, forming a liquid. A liquid boils when it is heated to form a gas or vapour.

For example, when the temperature of a system goes up, the matter in the system becomes more excited and active. If enough energy is pushed into a system, a phase change may occur as the matter moves to a more active state. Let's say you have a glass of water (H 2 O).

Matter can change from one state to another when physical conditions change: when energy, such as heat, is added or removed, a substance can change from a solid to a liquid, or from a liquid to a gas. For example, peanut butter does not flow like a liquid. It acts more like a solid even though it is very soft.
