Motivating Rudin's algorithm for approximating0-2. (d:1) On p.2, Rudin pulls out of a hat a formula which, given a rational number p, produces another rational number q such that q2is closer to 2 than p2is. This exercise points to a way one could come up with that formula.

Solution. Suppose that the unit sphere contains a line segment [x;y] where x;y 2 X and x 6= y. Then kax+(1 -a)yk = 1 for any a 2 [0;1]. Choose a = 1=2 then we get k1 2 (x + y)k = 1, that is kx + yk = 2: Since x and y belong to the unit sphere, we have kxk = kyk = 1. Hence kx+yk = kxk+kyk: Let us show that x;y are linearly independent. Assume y = fx for some fl 2 C. We have

Rudin intended Functional Analysis as an introduction, giving a lot of the basics of functional analysis as it took shape in the period of about 1900 to 1950. He consciously omitted many topics in order that his book be readable and not encyclopedic, as functional analysis has grown into a gigantic field, and was so during the time of the 1970s and 1980s when he wrote and revised his functional analysis text.

Functional analysis is a branch of mathematical analysis, the core of which is formed by the study of vector spaces endowed with some kind of limit-related structure (e.g. inner product, norm, topology, etc.) and the linear functions defined on these spaces and respecting these structures in a suitable sense. The historical roots of functional analysis lie in the study of spaces of functions ...
